REPORT

ON THE

Vital Statistics of New South Wales, 1912.

Population.

The estimated population of New South Wales at the end of 1912 was 1,778,962, of whom 935,979 were males and 842,983 females. Relatively there were 111 males to 100 females. The preceding year closed with a population of 1,698,736, so that the increase during 1912 was 80,226 persons, or at the rate of 4·72 per cent. Of the total population, there were 694,800, or 39·1 per cent., within the Metropolis of Sydney, and 1,084,162, or 60·9 per cent., in the "Country" districts. The population and vital statistics are exclusive of the records of the Federal Capital, the area which was transferred to the Commonwealth on 1st January, 1911.

The number of the people is ascertained primarily at the Census, which is taken every ten years. During the intervals estimates are made, which depend on the records of births and deaths, and of immigration and emigration. The last Census was taken on 2nd April, 1911, when the population, including aborigines, was 1,648,746; the population at the previous Census of 1901 was 1,359,133. The estimates for the intervening years have been revised to accord with the results of the Census of 1911.

As at 31st December.	Population.	Annual Increase.	Annual Increase, per cent.
1901	1,376,199	11,609	0·85
1902	1,397,858	21,659	1·57
1903	1,416,879	19,021	1·36
1904	1,440,919	24,040	1·70
1905	1,469,153	28,234	1·96
1906	1,498,609	29,456	2·00
1907	1,531,980	33,371	2·23
1908	1,560,026	28,046	1·83
1909	1,596,685	36,659	2·35
1910	1,638,220	41,535	2·60
1911	1,698,736	62,240	3·80
1912	1,778,962	80,226	4·72

Since 1901 there has been a very decided improvement in the annual increase in the population, as compared with the ten years 1891 to 1901. During 1912 the excess of births over deaths amounted to 33,107, and the excess of immigration over emigration to 47,119. The natural increase and the excess of arrivals are the highest yet recorded.

Marriages.

The number of marriages celebrated in New South Wales during 1912 was 16,664, corresponding to a rate of 9·58 per 1,000 of the population. The number is the highest on record, and the rate is the highest since 1859. The following table shows the average annual number of marriages and the rates per 1,000 of the population during each quinquennium of the last forty-three years:—

Period.	Average Number of Marriages.	Rate per 1,000 of Population.	Period.	Average Number of Marriages.	Rate per 1,000 of Population.
1870–74	4,091	7·77	1900–04	10,240	7·37
1875–79	4,987	7·88	1905–09	12,080	7·97
1880–84	6,738	8·39	1910	14,294	8·85
1885–89	7,679	7·67	1911	15,267	9·17
1890–94	7,954	6·80	1912	16,664	9·58
1895–99	8,700	6·74			

Until the year 1891 the increase in the number of marriages celebrated was remarkably steady, very few checks being experienced; but in 1892 there was a sudden decline, which continued until 1895, when the figures again took an upward movement, although the proportion married per 1,000 of the population did not reach the 1891 level until 1900. In 1901 the rate was the highest since 1886, but in the next two years it again declined largely. Since 1903, however, there has been a constant improvement. Compared with the rates of the quinquennium (1905–9), the marriages of 1912 disclose an advance of 21 per cent.

A more exact method of stating the marriage rate is to compare the marriages with the number of marriageable males and females in the community, since the marriage rate is mainly a function of age.

Of the bachelors marrying in New South Wales in 1912, only $4\frac{3}{4}$ per cent. are outside the ages 20–44; and of the spinsters less than 2 per cent. are outside the ages 15–39. These groups have been adopted as the marriage ages of the sexes, and the following table shows, at quinquennial intervals since 1871, the proportion of bachelors and of spinsters married, per 1,000 males and females within the specified groups who were unmarried:—

Year.	Proportion of Bachelors married per 1,000 unmarried males aged 20–44.	Proportion of Spinsters married per 1,000 unmarried females aged 15–39.
1871	65·60	87·07
1876	64·78	83·66
1881	65·21	82·32
1886	65·08	82·81
1891	57·85	71·28
1896	54·65	58·13
1901	65·92	62·69
1906	65·32	62·87
1911	79·25	75·03
1912	86·19	80·12

Until the year 1886 the rate for both sexes was fairly constant. There was then a heavy drop for 10 years, and in 1896 the lowest rate was reached for each sex. The next decennium showed steady and almost equal rates for males and females, and during the last six years a very high rate has prevailed generally. There has been a large increase in the marriage rate since 1906, amounting to 32 per cent. in the male rate and 27 per cent. in the female.

The marriage rate is a definite reflex of the comparative prosperity of a country; also a high marriage rate indicates a considerable proportion of marriageable persons in the community. From either point of view, the augury in respect of New South Wales must be regarded as highly favourable.

The following statement shows the marriage rate per 1,000 of the population in each State of the Commonwealth and New Zealand during the last six years, and in a number of European countries according to latest advices:—

State.	1907–1911.	1912.	Country.	1905–1909.	1910.
South Australia	8·83	9·62	Roumania	9·4	9·2
New South Wales	*8·51*	*9·58*	Hungary	9·1	8·6
Queensland	7·86	8·92	France	7·9	7·9
New Zealand	8·61	8·85	Prussia	8·1	7·8
Victoria	7·74	8·67	Italy	7·8	7·7
Western Australia	7·98	8·37	Austria	7·7	7·6
Tasmania	7·72	7·86	England and Wales	7·7	7·5
			Denmark	7·4	7·3
			Netherlands	7·3	7·2
			Spain	7·1	7·1
			Scotland...	6·9	6·5
			Norway	6·0	6·2
			Sweden	6·1	6·0
			Ireland	5·2	5·1

South Australia has the highest marriage rate in Australasia, followed by New South Wales, Queensland and New Zealand, in the order mentioned, with Tasmania last on the list. In 1912, in all the States, except Tasmania, the rates showed a decided improvement.

A comparison of the marriage rates of various countries may be misleading, on account of the different conditions of life prevailing, and the varying number of marriageable persons therein. In all European countries mentioned the rate is lower than in New South Wales.

Mark Signatures.—The number of persons who signed the marriage register with marks in the year 1912 was 142, equal to 4·26 per 1,000 persons married. The number of mark signatures has steadily declined for many years past. In 1870 the proportion of signatures made with marks was as high as 18·23 per cent. of the whole, while in 1912 the percentage had fallen to ·4, the decrease in illiteracy being, therefore, highly satisfactory.

The amount of illiteracy, as displayed by inability to sign the marriage register in the proper manner, was for many years greater amongst females than amongst males, the returns showing that this was the case in every year from the commencement of registration to 1887. This order was then reversed, although in four years since there has been a slightly greater proportion of mark signatures by females. The rate is now almost the same for both sexes, 4 per 1,000 in 1912 as compared with 145 per 1,000 for the males and 194 per 1,000 for the females in 1871. The improvement clearly is enormous.

Marriages, in Religions.—Of every hundred marriages celebrated in New South Wales, about ninety-eight are solemnised by the clergy. The actual figures for 1912 show that during that year 16,313 marriages were celebrated by clergy and 351 by registrars, giving the proportions of 97·9 per cent. and 2·1 per cent. respectively.

The Church of England celebrates the largest number of marriages, the Roman Catholic Church coming next, followed by the Presbyterian and the Methodist Churches.

Prior to 1908 a large number of marriages was celebrated annually at "Matrimonial Agencies," institutions which have come into existence within the last fourteen years, which combine the formalities of a district registrar's office with the attendance of a clergyman. As the Registrar-General in 1907 refused to renew the licenses of certain clergymen, there have been no marriages in matrimonial agencies since that year.

The

The following table shows the number and proportion per cent. of marriages registered by the principal denominations during 1912, in comparison with the preceding five years :—

Denomination.	Marriages, 1907–1911.	Proportion per cent.	Marriages, 1912.	Proportion per cent.
Church of England	27,144	40·25	6,979	41·88
Roman Catholic	12,235	18·14	2,922	17·54
Presbyterian	9,080	13·46	2,325	13·95
Methodist	8,370	12·41	2,248	13·49
Congregational	3,722	5·52	1,064	6·38
Baptist...	1,148	1·70	280	1·68
Hebrew	164	·24	58	·35
All other Sects	4,131	6·13	437	2·62
Matrimonial Agencies ...	92	·14	...	...
District Registrars	1,354	2·01	351	2·11
Total Marriages ...	67,440	100·00	16,664	100·00

In 1912 the denominations which show an increased rate as compared with the previous five ears were Church of England, Presbyterian, Methodist, Congregational, and Hebrew.

Condition before Marriage.—During the year 1912 of the males married, 15,652 were bachelors, 886 were widowers, and 126 were divorced. Of the females, 15,657 were spinsters, 826 were widows, and 181 were divorced. The proportion of males re-married was 6·1 per cent., and of females 6·0 per cent.

The following table shows at quinquennial intervals since 1881 the proportion of first marriages and re-marriages per 10,000 males and females respectively :—

Period.	Bachelors.	Widowers and Divorced Men.	Spinsters.	Widows and Divorced Women.
1881	9,087	913	9,044	956
1886	9,137	863	9,156	844
1891	9,229	771	9,216	784
1896	9,184	816	9,172	828
1901	9,270	730	9,268	732
1906	9,262	738	9,352	648
1907	9,341	659	9,387	613
1908	9,335	665	9,436	564
1909	9,339	661	9,413	587
1910	9,393	607	9,401	599
1911	9,407	593	9,456	544
1912	9,393	607	9,396	604

From this it appears that the proportion of persons re-marrying has declined both among widowers and widows by about one-third since the earliest period in the table, the tendency being for re-marriages of widows to decrease at a slightly greater rate. There was a rise in the proportion between 1891 and 1896, which was followed by a larger fall during the next five years, so that the proportion of re-marriages was lower in 1901 than in 1891.

Age at Marriage.—Of the 16,664 couples married in 1912, the ages of 16,660 bridegrooms and of 16,661 brides are known. An examination of the figures shows that in 71·5 per cent. of the marriages the husband was older than the wife ; in 10·0 per cent. the ages of the contracting parties were the same ; while in the remaining 18·5 per cent. of the unions the bride was older than the bridegroom.

The results of a tabulation of the respective ages of bridegrooms and brides in 1912 are shown in the following table :—

Ages of Bridegrooms.	Ages of Brides.												
	Under 18	18	19	20	21 — 24	25 — 29	30 — 34	35 — 39	40 — 44	45 — 49	50 and over	Not stated.	Total.

Total	695	782	1,086	1,171	6,076	4,011	1,475	724	295	177	169	3	16,664

The following statement shows the average age at marriage both of bridegrooms and brides for each of the last ten years. The difference between the ages at marriage of males and females is about four years, the males being the older :—

Year.	Average Age of Bridegrooms.	Average Age of Brides.	Year.	Average Age of Bridegrooms.	Average Age of Brides.
	Years.	Years.		Years.	Years.
1903	29·20	25·04	1908	29·02	25·19
1904	29·00	24·93	1909	29·11	25·30
1905	29·13	24·96	1910	29·02	25·31
1906	29·23	25·08	1911	28·81	25·32
1907	29·20	25·20	1912	28·91	25·47

The average age at marriage, both of bridegrooms and brides, has remained practically constant during the last ten years, although there is now a tendency to a slightly lower average on the part of bridegrooms and to a slightly higher average on the part of brides. The above figures relate to all persons marrying during the year, and include those re-marrying. The average ages of those marrying for the first time during 1912 were, of bachelors 28·35 years, and of spinsters 25·02 years, or about seven months lower in the case of bridegrooms and five months lower in the case of brides.

Marriage of Minors.—The number of persons under 21 years of age married during 1912 was 4,503, or 13·5 per cent. of the total. The proportion of bridegrooms who were minors was 4·6 per cent., and of brides 22·4 per cent. The proportion of bridegrooms who were minors was considerably above the average, but in the case of the brides the proportion was below the average. The figures at quinquennial intervals since 1881 are appended.

Period.	Minors.		Percentage of—	
	Bridegrooms.	Brides.	Bridegrooms.	Brides.
1881	149	1,660	2·37	26·42
1886	187	1,806	2·39	23·12
1891	177	2,085	2·09	24·65
1896	212	2,065	2·49	24·31
1901	351	2,546	3·33	24·15
1906	497	2,837	4·30	24·56
1911	701	3,499	4·59	22·92
1912	769	3,734	4·61	22·41

It will be seen from this table that the proportion of minors marrying is increasing amongst bridegrooms, and has a tendency to decrease amongst brides.

Births.

The number of births during 1912 was 51,933, equal to a rate of 29·90 per 1,000 of the total population. The actual number of births was the highest ever recorded in this State, and the rate was 5 per cent. above the average for the last ten years. The birth-rate, which fell away sharply after 1888, declined largely year by year down to 1903. Since that year there has been an improvement, the rate in 1911 being the highest since 1895. The following table shows the average annual number of births and the birth-rate per 1,000 of the total population in quinquennial periods since 1870 :—

Period.	Number of Births.	Birth-rate per 1,000 of total Population.	Period.	Number of Births.	Birth-rate per 1,000 of total Population.
1870–74	20,733	39·36	1900–04	37,498	26·99
1875–79	24,388	38·51	1905–09	41,788	27·56
1880–84	30,417	37·89	1910	45,533	28·17
1885–89	36,877	36·85	1911	47,677	28·64
1890–94	39,550	33·80	1912	51,993	29·90
1895–99	37,042	28·68			

The rates shown above are calculated by the usual crude method of relating the births to the total population. It is unsatisfactory, for several reasons, so to measure the birth-rate. A preferable method for purposes of strict analysis is to relate the births according to the ages of the mothers to the total women living at corresponding ages. This method can be followed only at Census periods, since an accurate estimate of the number living at various age-groups at any other period is very difficult, on account of migration and other influences.

The ages and conjugal condition of the people of New South Wales having been obtained at the Census of 1911, the birth rates per 1,000 women living at various groups of reproductive ages from 15 to 45 years have been calculated for the three Census periods 1891, 1901, and 1911, and are shown in the following table, distinguishing the total births from the legitimate, the illegitimate rates being shown on a later page. The total births per 1,000 of all females living at each age were as follows :—

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
15–19	35·30	30·87	33·75	4·4
20–24	170·90	134·65	141·45	17·2
25–29	247·48	177·95	187·35	24·3
30–34	238·81	168·42	161·20	32·5
35–39	196·15	136·60	122·27	37·7
40–44	96·61	70·79	54·51	43·6
15–44	161·74	117·46	118·50	26·7

The crude birth-rate declined sharply after 1889, and has never recovered the figure at which it then stood. From this table it will be seen that the decline has been general at all age-groups since 1891, which is the first year that the ages of mothers is available. As regards the relative decrease at each age, there has been a drop, which has increased as the age increases. At ages 15-19 the decrease was 4 per cent.; at ages 25-29, 24 per cent.; at ages 40-44, it was 44 per cent. For all ages the average was 27 per cent. Although the general rate shows a slight advance in 1911 when compared with 1901, the rate for mothers over 30 years of age shows a regular decrease from period to period, from which it would appear that the rate has been maintained only by births the result of recent marriages.

The next table shows the legitimate births per 1,000 married women at each age.

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
Years.				
15–19	471·09	556·54	512·31	(+) 8·7
20–24	410·49	390·27	392·12	4·5
25–29	348·81	292·90	301·33	13·6
30–34	288·18	221·41	219·90	23·7
35–39	233·04	168·03	156·98	32·6
40–44	116·76	86·17	69·49	40·5
15–44	292·87	228·79	229·70	21·6

(+) Indicates increase.

This table shows that the rate at the youngest ages, 15-19, has advanced, and in 1911, although lower than in 1901, was higher than in 1891. Thence onward, however, as the age advances the decline has been general, amounting to 21·6 per cent. on the whole, and the disinclination of mothers for large families is clearly shown.

The birth-rate per 1,000 of the population of each State of the Commonwealth and of New Zealand during the last six years, and of a number of European countries, according to the latest advices, is given in the following table :—

State.	1907-11.	1912.	Country.	1905-9.	1910.
Tasmania	28·15	30·53	Roumania	40·2	39·8
New South Wales ..	*27·99*	*29·90*	Hungary	36·8	35·7
Queensland	27·17	29·70	Spain	34·0	33·1
Western Australia...	29·04	28·86	Italy	32·3	32·9
South Australia ...	26·05	28·65	Austria	33·9	32·5
New Zealand ...	26·82	26·48	Prussia	32·9	30·5
Victoria	24·69	26·45	Netherlands	30·0	28·6
			Denmark	28·2	27·5
			Scotland	28·1	26·2
			Norway	26·6	26·1
			England and Wales...	26·7	25·1
			Sweden	25·6	24·8
			Ireland	23·4	23·3
			France	20·1	19·7

In Australasia, Tasmania has the highest rate, and Victoria the lowest. The comparatively high rate in Western Australia, due to the larger proportion of married women of child-bearing ages in its population, has been exceeded by the rates in Tasmania, New South Wales, and Queensland. Generally the decline which has characterised the birth-rates not only of Australian but also of European countries, has discontinued as far as Australia is concerned, as all the rates in 1912 show an advance on those of the previous five years. The birth-rate for Australia is lower than in most of the countries of the old world; but, as will be shown subsequently, this is more than counteracted by a much lower death-rate.

Birth-rates—Metropolis and Country.—Dividing the State into the Metropolitan and Country districts, there were during 1912, in the former, 20,140 births, and in the latter, 31,853, corresponding to rates of 29·80 and 29·97 per 1,000 of population respectively. The Country has shown a higher rate than the Metropolis since 1893; prior to that year the Metropolitan rate was the higher.

Period.	Number of Births.			Births per 1,000 of Population.		
	Metropolis.	Country.	New South Wales.	Metropolis.	Country.	New South Wales.
1880–84	49,058	103,026	152,084	40·16	36·90	37·89
1885–89	65,866	118,517	184,383	41·50	34·69	36·85
1890–94	68,754	128,998	197,752	34·11	33·63	33·80
1895–99	61,224	123,986	185,210	26·73	29·75	28·68
1900–04	63,694	123,795	187,489	25·16	28·05	26·99
1905–09	72,409	136,529	208,938	25·50	28·80	27·56
1910	16,204	29,329	45,533	26·39	29·27	28·17
1911	17,829	29,848	47,677	27·88	29·11	28·64
1912	20,140	31,853	51,993	29·80	29·97	29·90

The highest rate exhibited for the whole of New South Wales during the last thirty years was 38·65 in 1880. The maximum rate for the Metropolis was reached in 1884 when the births were 43·88 per thousand, and in the Country Districts the greatest number of births in proportion to the population occurred in 1880 when the rate was 38·73 per thousand.

The rate has been declining in both districts since the earliest period, but not to the same extent in the Country as in the Metropolis. In the Metropolis there was a heavy fall from 1889 to 1894, and again from 1895 to 1899; in the Country there was a corresponding fall, but it began earlier than in the Metropolis.

Metropolis. In both Metropolis and Country the rates fluctuated very slightly during the years 1904–9, but during the last three years there has been a slight improvement in each division; the Country rate, on the average, has been three per 1,000 of the population better than that of the City.

Sexes of Children.—Of the 51,993 children born during the year, 26,628 were males and 25,365 females, the proportion being 105 males to 100 females. In no year, so far as observation extends, have the female births exceeded in number those of the males, although the difference has sometimes been very small. The excess during the past fifty-three years has ranged from 2 per cent. in 1875, 1876, and 1901 to 8 per cent. in 1889, the average being 5·0 per cent.

Generally speaking, illegitimate births show greater equality of the sexes than legitimate, and in some years they actually show a majority of female children, such instances having occurred twice during the last twenty years. It is a curious coincidence that the proportion of males born out of wedlock was abnormally low in 1886 and abnormally high in 1901, while the reverse was the case in regard to legitimate births in those years.

Illegitimacy.—The number of illegitimate births in 1912 was 2,934, equal to 5·64 per cent. of the total births. Comparing the records since 1880, it is found that the proportion of illegitimate to total births has continually and rapidly increased throughout the State, notably in the city and suburbs of Sydney. The highest proportion was reached in 1905, and since that year there has been a decline, as the actual number of illegitimate births has remained fairly constant, while the legitimate births have increased. The proportion in the Metropolis in 1912 was 8·18 per cent. of the total births, and in the Country 4·04 per cent. Doubtless, the smaller proportion in the Country districts is caused by the natural gravitation of mothers to the Metropolis, due to the presence of maternity hospitals in the Capital.

The method of stating the illegitimate as a proportion of the total births is erroneous, because the illegitimate births have no necessary relation with the legitimate births, and because they are compared with a standard which has been declining for several years, and which is itself variable; the proportion of illegitimate to legitimate births has increased, because the number of legitimate births relatively to the population has decreased largely.

The following table is therefore presented—on a similar basis to those on a previous page relating to the total, and to the legitimate births—showing the illegitimate births per 1,000 unmarried women at each age for the three Census periods 1891, 1901, and 1911 :—

Ages of Mothers.	1891.	1901.	1911.	Decrease per cent. in rates, 1891 to 1911.
Years.				
15–19	10·81	11·14	9·85	8·9
20–24	25·80	23·45	19·30	25·2
25–29	25·73	18·38	18·64	27·6
30–34	27·73	17·46	15·69	43·4
35–39	23·79	14·83	13·57	43·0
40–44	5·68	7·83	4·24	25·4
15–44	18·41	16·10	14·18	23·0

By the usual method of stating the illegitimate births as a proportion of the total births, it has appeared that illegitimacy was increasing, but from the above table it will be seen that the illegitimate rate, based upon the number of unmarried women, has steadily decreased at all ages, and amounted on the average to 23 per cent. during the twenty years since 1891. The illegitimate rate shows the same characteristics as the legitimate rate. The decline has been general at all ages, but larger than in the legitimate rate.

An Act to legitimise children, born before marriage, on the subsequent marriage of their parents, was passed in 1902. Under the provisions of this Act such children are deemed to be legitimate on registration, and are entitled to the status of children born in wedlock, provided that no legal impediment to the marriage of the parents existed at the time of the birth of the child. Since the Act was passed 2,542 registrations have been made.

Year.	Registrations.	Year.	Registrations.
1902	6	1909	267
1903	158	1910	288
1904	173	1911	394
1905	175	1912	405
1906	191		
1907	247	Total...	2,542
1908	238		

Plural Births.—During the year 1912 there were 7 cases of triplets, comprising 15 males and 6 females, and 540 cases of twins, comprising 490 males and 586 females—in all, 1,076 children (4 still-births not being included). Of these 547 cases of plural births, 528 were legitimate and 19 illegitimate. The number of children born as triplets and twins formed 2·11 per cent. of the total births.

The following table shows the number of cases of twins, triplets, and quadruplets born in New South Wales during the twenty years 1893–1912, excluding those stillborn, and distinguishing legitimate and illegitimate :—

Cases of—	Legitimate.	Illegitimate.	Total.
Twins	7,814	400	8,214
Triplets	76	5	81
Quadruplets ...	3	...	3

The total number of confinements recorded during the twenty years was 797,769. It follows therefore, that the rate per million confinements was 10,296 cases of twins, 102 of triplets, and 4 cases of 4 children at a birth. Stated in another way, there were 10·4 plural births in every 1,000 confinements.

The

The smallest proportion of plural births is found amongst women below age 20; the proportion increases steadily with the age of the mothers until it reaches a maximum with women between the ages of 35 and 40 years, after which there is a decline, but the decline does not bring the ratio back to its starting-point, for at ages 45 and over the plural births are 1 to every 128 confinements recorded, whereas under 20 years the proportion is 1 to 189.

The results of the observations for the twenty years, 1893–1912, will be found in the following table; the figures relate to legitimate births only:—

Age-groups of Mothers.	All Births.	Plural Births. ? Cases twins only	Plural Births per 1,000 of all Births.
Years.			
Under 20	29,555	156	5·28
20–24	171,389	1,122	6·55
25–29	212,208	2,102	9·91
30–34	166,814	2,203	13·21
35–39	114,519	1,710	14·93
40–44	44,965	555	12·34
45 and over	4,845	38	7·84

It is a remarkable fact that of 7,886 plural births, 4,506 occurred to mothers whose ages were 30 years or upwards; this gives a proportion of 57 per cent., whereas of all legitimate births only 45 per cent. occurred at those ages.

Natural Increase.

The excess of births over deaths, that is, the "natural increase," was 33,107 in 1912, and was the highest yet recorded. The excess of births over deaths does not show a steady increase or decrease, but fluctuates somewhat, as might be expected. In the Metropolis the least excess was in 1880, viz., 3,434, and the highest in 1912, when the number reached 12,459. In the Country districts the number ranged from 12,278 in 1882 to 20,648 in 1912.

Year.	Natural Increase.					Increase per cent. of Population at end of previous year.
	Metropolis.	Country Districts.	Whole of State.			
			Males.	Females.	Total.	
1903	6,836	12,633	8,949	10,520	19,469	1·39
1904	7,540	15,767	11,124	12,183	23,307	1·64
1905	7,999	16,524	11,497	13,026	24,523	1·70
1906	8,281	17,692	12,351	13,622	25,973	1·77
1907	8,096	17,689	12,187	13,598	25,785	1·72
1908	8,825	17,610	12,320	14,115	26,435	1·73
1909	9,312	18,617	13,297	14,632	27,929	1·79
1910	9,839	19,503	14,094	15,248	29,342	1·84
1911	10,856	19,642	14,504	15,994	30,498	1·86
1912	12,459	20,648	15,526	17,581	33,107	1·95

The rate of natural increase is now 1·95 per cent., as against 2·25 per cent. in 1890, the falling-off being due entirely to the decline in the birth-rate, as there has been a constant improvement in the death-rate.

Although the males born are more numerous than the females, the actual increase of population from the excess of births over deaths is greatly in favour of the females. The male population exceeds the female, and there is a correspondingly larger number of deaths of males. There is also a greater mortality amongst male than amongst female children, and from this cause alone the natural excess of male births is almost neutralised. During the ten years which closed with 1912 the number of females added to the community by excess of births exceeded the males by 14,670, or 12 per cent.

Although the rate of natural increase in New South Wales is low as compared with that of twenty years ago, it is exceeded by no country outside Australasia, as will be seen from the following table. The figures represent the birth and death rates, and the difference between them (the natural increase) per 1,000 of population in each country—in the Australian States and New Zealand for 1912, and in the majority of the other countries for 1910.

Country.	Birth-rate.	Death-rate.	Natural Increase.	Country.	Birth-rate.	Death-rate.	Natural Increase.
Tasmania	30·5	10·7	19·8	Japan (1909)	34·2	22·0	12·2
New South Wales	*29·9*	*10·9*	*19·0*	England and Wales ...	25·1	13·5	11·6

South Australia	28·7	10·3	18·4	Sweden	24·8	14·0	10·8
New Zealand	26·5	8·9	17·6	Hungary	35·7	25·2	10·5
Netherlands	28·6	13·6	15·0	Spain	33·1	23·3	9·8
Denmark	27·5	12·9	14·6	Switzerland (1909) ...	25·5	16·1	9·4
Roumania	39·8	25·2	14·6	Belgium (1909)	23·7	15·8	7·9
Prussia	30·5	16·0	14·5	Servia (1909)	36·5	29·3	7·2
Victoria	26·5	12·3	14·2	Ireland	23·3	17·1	6·2
Finland	30·2	16·6	13·6	Chile	38·4	32·5	5·9
Italy	32·9	19·6	13·3	France	19·7	17·9	1·8
Norway	26·1	13·5	12·6				

It will be seen that the countries with the highest birth-rate have not necessarily the highest rate of natural increase. The increase in population also depends upon the death-rate, which to a considerable extent is influenced by the birth-rate. Tasmania and New South Wales, owing to exceptionally favourable death-rates and increasing birth-rates, stand first on the list.

Ages of Mothers.

During the twenty years, 1893–1912, the ages of the women giving birth to children ranged from 11 to 58 years. As might be expected, the majority of the very young mothers were unmarried; thus, of 10,358 mothers under 18 years of age, 5,249 were unmarried. The total number of married women who gave birth to children during the twenty years was 744,351, the ages of whom were as follows. The proportion of married mothers at each age per 10,000 of all ages is also shown.

Ages of Married Mothers.	Number of Mothers.	Number of Mothers at each age per 10,000 of total Mothers.	Ages of Married Mothers.	Number of Mothers.	Number of Mothers at each age per 10,000 of total Mothers.
Years.			Years.		
13	2	...	25	43,410	583
14	21	...	26	43,881	590
15	159	2	27	42,766	575
16	1,073	14	28	42,737	574

18	8,781	118	30–34	166,814	2,241
19	15,765	212	35–39	114,519	1,538
20	21,257	286	40–44	44,965	604
21	29,810	401	45 and over	4,845	65
22	36,096	485	Not stated	56	1
23	41,020	551			
24	43,206	580	Total ...	744,351	10,000

In two cases the age of the mother is stated as 55 years; in another case as 56 years; and in another as 58. As these four cases were outside the usual experience, inquiries were made, with the result that the accuracy of the records was confirmed. It may be mentioned that in the first two cases the ages of the fathers were 45 and 55 years; in the third case, 58 years; and in the fourth case, 64 years. It is found that the ages of the mothers of one-fourth of the children born do not exceed 25 years, and that before women pass their twenty-ninth year they give birth to one-half their offspring. Twenty-two per cent. of the births occur after age 35, and less than 7 per cent. after age 40 is reached.

Similar information regarding the ages of the fathers might also be shown, but is omitted because the age of the mother is the great predominant factor in deciding the number of children who will be born.

The mothers of illegitimate children are in some cases very young, as will be seen from the following table, which shows the ages of mothers who gave birth to illegitimate children during the twenty years 1893–1912. The proportion of unmarried mothers at each age per 10,000 of all ages is also shown:—

Age of Unmarried Mothers.	Number of Mothers.	Number of Mothers per 10,000.	Age of Unmarried Mothers.	Number of Mothers.	Number of Mothers per 10,000.
Years.			Years.		
11	1	...	28	1,589	297
12	2	...	29	1,341	251
13	29	6	30	1,301	244
14	140	26	31	763	143
15	576	108	32	927	174
16	1,529	286	33	765	143
17	2,972	556	34	764	143
18	4,354	815	35	744	139

23	3,645	682	40 and over	1,050	197
24	2,981	558	Not stated	145	27
25	2,484	465			
26	2,111	395	Total ...	53,418	10,000
27	1,744	326			

Two-thirds of the illegitimate children are born to mothers between the ages of 15 and 25, and one-half to women aged from 17 to 22 years.

Deaths.

The deaths during 1912 numbered 18,886, equal to a rate of 10·86 per 1,000 of the population, which is the highest since 1903, and is 3 per cent. below the mean rate of the last ten years. The total includes 11,102 males and 7,784 females, so that amongst males the rate was 12·16, and amongst females 9·43 per 1,000 living of each sex. The average annual number of deaths of each of the sexes, with the rate per thousand, in quinquennial periods from 1870, is given below.

Period.	Average Annual Number of Deaths.			Death-rate per 1,000 of total Population.		
	Males.	Females.	Persons.	Males.	Females.	Persons.
1870–74	4,391	2,948	7,339	15·58	12·32	13·93
1875–79	6,199	4,360	10,559	17·99	15·10	16·67
1880–84	7,286	5,124	12,410	16·55	14·14	15·46
1885–89	8,461	6,043	14,504	15·43	13·36	14·49
1890–94	8,877	6,344	15,221	14·06	11·77	13·01
1895–99	9,002	6,514	15,516	13·11	10·77	12·01
1900–04	9,195	6,733	15,928	12·65	10·17	11·47
1905–09	9,076	6,583	15,659	11·52	9·04	10·33
1910	9,349	6,842	16,191	11·13	8·82	10·02
1911	10,004	7,175	17,179	11·52	9·01	10·32
1912	11,102	7,784	18,886	12·16	9·43	10·86

The death-rate has fallen steadily from the earliest period to the latest amongst both sexes, but slightly more for males than for females. The death-rate for males is, however, about one-fourth higher than for females, the reason being that males are exposed to more risks than females, and that male infants are the more delicate. It will be noticed that the death-rate has declined largely since the period 1890–94, and is thus coincident with the decline in the birth-rate. The falling birth-rate has influenced the death-rate in so far as it has affected the age constitution of the population by reducing the proportion living at the first five years where the mortality is high, and at the same time increasing the proportion living at ages from 5 to 20 where the mortality is low. The decline in the death-rate is also coincident with the inauguration of the Metropolitan sewerage scheme, as mentioned below.

For comparative purposes a table of the death-rates per 1,000 for each of the Australian States and New Zealand, during the last six years, and a number of European countries according to the latest advice, is given below :—

State.	1907–1911.	1912.	Country.	1905–1909.	1910.
Victoria	11·63	12·25	Roumania	26·0	25·2
Western Australia	10·63	11·07	Hungary	25·9	23·6
Queensland ...	10·12	10·96	Spain	24·8	23·3
New South Wales...	*10·31*	*10·86*	Austria	23·2	21·2
Tasmania	10·59	10·73	France	19·6	17·9
South Australia ...	9·99	10·28	Ireland	17·3	17·1
New Zealand ...	9·75	8·87	Prussia	18·0	16·0
			Scotland	16·3	15·3
			Sweden	14·6	14·0
			Netherlands ..	14·7	13·6
			England and Wales	15·1	13·5
			Norway	14·1	13·5
			Denmark	14·1	12·9

New South Wales occupies the fourth place on the list for 1912, more favourable rates being shown by New Zealand, South Australia, and Tasmania.

The comparatively favourable conditions of Australasia will be manifest from an inspection of these rates.

It might have been expected that in any case the rates in the European countries would be higher than in New South Wales on account of the larger proportions of old persons in their populations, but in addition it must be remembered that some of the endemic scourges of the old world are unknown in Australia ; also, apart from climatic conditions, which are most favourable here, the social condition of the great body of the people is far superior to that of Europeans, and their occupations on the whole more conducive to health. The enforcement also of the provisions of many Acts of Parliament dealing with the general health of the community, such as, the Public Health Act, Dairies Supervision Act, and Pure Food Act, besides regulations framed by local government authorities, conduce to the good health of the people.

Deaths—Metropolis and Country.—It is not possible to show the exact difference between urban and rural mortality in New South Wales, but an approximate idea may be obtained from a comparison of the experience of the Metropolis with that of the Country Districts, although a few large towns are contained in the latter. Separating the State into these two broad divisions, there were, during 1912, 7,681 deaths in the Metropolis and 11,205 in the remainder of the State, corresponding to the rates of 11·37 and 10·54 per 1,000 living respectively. The average annual number of deaths and the rate per thousand in each of these divisions since 1880, in five-year periods, is given in the subjoined table :—

Period.	Metropolis.		Country Districts.		New South Wales.	
	Average Number of Deaths.	Rate per 1,000.	Average Number of Deaths.	Rate per 1,000.	Average Number of Deaths.	Rate per 1,000.
1880–84	5,033	20·60	7,377	13·21	12,410	15·46
1885–89	6,181	19·47	8,323	12·18	14,504	14·49
1890–94	5,979	14·83	9,242	12·05	15,221	13·01
1895–99	5,634	12·39	9,882	11·86	15,516	12·01
1900–04	5,845	11·54	10,083	11·42	15,928	11·47
1905–09	5,979	10·53	9,680	10·21	15,659	10·33
1910	6,365	10·36	9,826	9·80	16,191	10·02
1911	6,973	10·90	10,206	9·95	17,179	10·32
1912	7,681	11·37	11,205	10·54	18,886	10·86

Both in the Metropolis and in the Country the rate has declined steadily, but very much more in the Metropolis, so that there the rate is now not a great deal higher than in the Country Districts, whereas twenty-five years ago it was 50 per cent. higher. The fall began in the Metropolis after 1889, the year when the improved sewerage system was installed, and about the same time that the Dairies Supervision Act came into operation. The decline in the rates for each division and for the State will be emphasised when it is stated that the metropolitan rate fell from 19·5 in the period 1885–9 to 11·4 per 1,000 in 1912, or 42 per cent. ; the country rate from 12·2 to 10·5, or 14 per cent. ; and the rate for the whole State from 14·5 to 10·9, or 25 per cent.

Mortality of Infants and Young Children.

Children under 1 year.—The number of children under 1 year of age who died in 1912 was 3,707, equal to a rate of 71·3 per 1,000 births, which is, with the exception of last year, the lowest on record, and is 10 per cent. below the mean rate for the last ten years. Male infants died at the rate of 78·1 per 1,000 births, and female infants at the rate of 64·2 per 1,000 births. To the total the Metropolis contributed 1,530 deaths, or 76·0 per 1,000 births, and the Country 2,177, or 68·3 per 1,000 births.

The

The next table gives the average annual number of deaths of children under 1 year, in quinquennial periods since 1880, in the Metropolis and Country, and the proportion per 1,000 births.

Period.	Metropolis.		Country.		New South Wales.	
	Deaths under 1.	Rate per 1,000 Births.	Deaths under 1.	Rate per 1,000 Births.	Deaths under 1.	Rate per 1,000 Births.
1880-84	1,707	174·0	1,956	94·9	3,663	120·4
1885-89	2,168	164·6	2,256	95·2	4,424	120·0
1890-94	1,908	138·8	2,471	95·8	4,379	110·7
1895-99	1,646	134·4	2,572	103·7	4,218	113·9
1900-04	1,416	111·2	2,399	96·9	3,815	101·7
1905-09	1,255	86·7	2,035	74·5	3,290	78·7
1910	1,329	82·0	2,068	70·5	3,397	74·6
1911	1,268	71·1	2,045	68·5	3,313	69·5
1912	1,530	76·0	2,177	68·3	3,707	71·3

The infantile mortality rate has improved more in the Metropolis; in fact, until 1900, in the Country districts it was increasing. In the year 1904 there was a large decrease in both divisions compared with the rate for the previous five years, which improvement continued in 1905 and 1906. In 1907, in consequence of an epidemic of whooping-cough, the rate took an upward movement, proportionally greater in the Country than in the Metropolis, but it has since declined. The rate in the Country Districts has always been more favourable than in the Metropolis, although it will be seen that the difference now is not nearly so great as twenty, or even ten, years ago.

The improvement in the rate in the Metropolis is, no doubt, partly due to the preventive measures taken by the Sydney Municipal Council to reduce the deaths from diarrhœal diseases, which have largely contributed to the infantile mortality. These measures were initiated in 1903 by the distribution of instructional circulars and pamphlets for the guidance of mothers regarding the care and feeding of young children. These circulars are despatched to the mother immediately after the registration of a birth in the thickly-populated areas of the city. In 1904 the scheme was supplemented by the appointment of a trained female inspector to visit the houses in those districts as soon as possible after the registration of a birth therein, with the object of instructing the mothers and encouraging them in the exercise of hygienic principles in the care of their infants. The satisfactory results achieved within the city boundaries led to the appointment in 1909 of an additional health visitor to carry out similar work in the more populous suburbs immediately surrounding the city.

Of the total number of deaths of infants under 1 year of age, nearly one-third die within a week of birth, by the end of the first month the proportion is over two-fifths, and by the end of three months three-fifths. Judging by the experience of the last five years, it may be said that one in every 46 children born dies within a week of birth. The following statement shows for 1912, in comparison with the average of the five preceding years, the deaths per 1,000 births during each of the first four weeks after birth, and then for each successive month. The experience in the Metropolis is distinguished from that in the Country Districts, and both sexes are taken together. Also for the year 1912, illegitimate children are distinguished from legitimate for the State as a whole.

Age.	Metropolis.		Country.		New South Wales.			
						1912.		
	1907-11.	1912.	1907-11.	1912.	1907-11.	Legitimate.	Illegitimate.	Total.

Total under 1 year ...	82·2	76·1	73·1	68·4	76·3	65·5	168·7	71·3

In the first week of life the mortality is more than five times as great as in the second, and in the second about twice as great as in the fourth. From the first month to the second the mortality falls rapidly, and from the second to the twelfth gradually. Comparing the mortality in the two divisions of the State—Metropolitan and Country—the usual experience is that at every stage of life children die more quickly in the Metropolis. In 1912 the metropolitan rate was 76·1 and the country 68·4 per 1,000 births, the latter being 10 per cent. lower than the former. At the earlier ages the difference was least, the metropolitan rate being 30·5 per 1,000 during the first four weeks, as compared with 29·5 in the country. After the first month the difference fluctuated, but the rate was greater in the Metropolis at every age except the tenth month.

This table also shows the great waste of life among illegitimate children, the mortality under one year being 168·7 per 1,000 births as compared with 65·5 among legitimate children. The largest proportional excess is not immediately after birth, but about four months later. During the first week the mortality of illegitimates exceeds that of legitimates by 71 per cent., thereafter it increases until in the second month the excess is 439 per cent.; after this it drops irregularly, until in the eleventh month the excess is about 4 per cent.

Children under 5 years.—Taking account of the first five years of life, it is found that there has also been a great improvement in the rates for those ages, and, at the same time, there is apparent the reason for the excessive death-rate in the Metropolis as compared with the Country Districts. At every period in the table the metropolitan rate is the higher—in some cases over 50 per cent. higher, and never below 18 per cent. in excess.

The following table shows the mortality in each division, in quinquennial periods, since 1890, of children under 5 years of age :—

Period.	Metropolis.		Country.		New South Wales.	
	Number.	Rate per 1,000 living.	Number.	Rate per 1,000 living.	Number.	Rate per 1,000 living.
1890–94	13,370	48·45	17,728	32·06	31,098	37·52
1895–99	11,027	40·77	17,436	30·97	28,463	34·15
1900–04	9,233	35·17	16,049	29·64	25,282	31·44
1905–09	8,062	27·61	13,612	23·39	21,674	24·80
1910	1,751	26·51	2,812	21·81	4,563	23·40
1911	1,625	23·79	2,694	20·10	4,319	21·35
1912	2,142	29·06	2,982	21·74	5,124	24·30

The improvement in the Metropolis has been greater than in the Country; in the former the rate has decreased by 40 per cent. since 1890, and in the latter by 32 per cent. In the Country the rate did not vary a great deal until 1904, when there was a large decline, which has continued. During the year 1912 there was a saving of the lives of 19 in every 1,000 children under 5 years of age in the Metropolis and 10 in every 1,000 in the Country, as compared with the mortality rate twenty years ago.

Legitimate and Illegitimate.—The last table but one distinguishes legitimate from illegitimate children, and, together with the following figures, shows with what calamitous results illegitimacy is attended. The table appended gives, for 1912, and for the five years preceding, the death-rates of illegitimate children under 1 and under 5 years of age, as compared with legitimate children of like ages.

Age.	Legitimate.		Illegitimate.		Total.	
	Deaths.	Rate per 1,000 living.	Deaths.	Rate per 1,000 living.	Deaths.	Rate per 1,000 living.
Under 1 year—						
1907–11	14,347	69·29	2,577	176·16	16,924	76·34
1912	3,212	65·47	495	168·71	3,707	71·30
Under 5 years—						
1907–11	19,325	21·86	3,040	53·82	22,365	23·78
1912	4,522	22·71	602	51·28	5,124	24·30

It will be seen how unfavourable is the position, and how reduced is the chance of living, of the illegitimate child as compared with the legitimate, since at each age-group the death-rate of the illegitimate is more than twice that of the legitimate. In 1912 one-sixth of the illegitimate children born did not live through the first year.

Index of Mortality.

In order to compare the death-rates of New South Wales with those of the other Australian States on a uniform basis, the death-rate of each State (index of mortality) has been calculated on the assumption that its population contained the same proportion at each of five age-groups (under 1, 1–19, 20–39, 40–59, 60 and over) as was contained in the population of Australia as a whole at the Census of 1911. Similarly, in obtaining the index of mortality of each capital city, the population at the Census of 1911 of all the capital cities was taken as a standard.

The indexes of mortality during 1912 were found to be as follows, and for purposes of comparison the crude rates are attached :—

State.	Index of Mortality.	Crude Death-rate.	City.	Index of Mortality.	Crude Death-rate.
New South Wales ...	10·73	10·86	Sydney	11·19	11·37
Victoria	11·59	12·25	Melbourne	13·22	14·03
Queensland	11·11	10·96	Brisbane	12·68	13·05
South Australia ...	9·83	10·28	Adelaide	12·10	13·04
Western Australia ...	12·03	11·07	Perth	*	*
Tasmania	10·66	10·73	Hobart	13·97	15·79

* Not available.

Sydney has the most favourable index of mortality of all the capitals, and New South Wales is third amongst the States. South Australia has the lowest crude rate, and Victoria the highest; but the adjusted rate shows Victoria in a better position.

Causes of Death.

Until 1906 the system of classifying the causes of death was that adopted by the Registrar-General, England. In 1906, however, at a conference of Australian Statisticians it was agreed to adopt the Bertillon classification, and causes of death in New South Wales are now tabulated according to that classification. The Bertillon system differs in many cases from the old, and in some rather materially, so that a comparison of the results of the last seven years with previous years is, to some extent, impaired.

In

In the following table will be found the principal causes of death arranged in the order of fatality, together with the average number of deaths from the same causes during the previous five years, due allowance having been made for the increase of population :—

Causes of Death.	Number, 1912.	Average Number, 1907-11.	Causes of Death.	Number, 1912.	Average Number 1907-11.
Organic Diseases of the Heart ...	1,701	1,607	Meningitis	167	170
Endocarditis	114	116	Convulsions (under 5)	163	202
Diarrhœa and Enteritis (under 2) ...	1,402	1,208	Congenital Malformations	156	115
,, ,, (over 2) ...	339	323	Intestinal Obstruction	149	144
Cancer	1,312	1,252	Diabetes	149	154
Old Age	1,263	1,075	Cirrhosis of the Liver	148	125
Pneumonia	1,098	1,004	Appendicitis	136	143
Tuberculosis—Lungs	1,078	1,161	Influenza	131	198
Accident	1,027	1,005	Whooping-cough	118	219
Bright's Disease	840	729	Gastritis	114	111
Premature Birth	828	767	Embolism, Thrombosis	110	97
Hæmorrhage, &c., of the Brain ...	734	700	Acute Rheumatism	102	85
Bronchitis	552	571	Alcoholism	77	54
Congenital Debility	377	511	Epilepsy	70	68
Measles	371	60	Syphilis...	60	57
Puerperal Condition	305	297	Dysentery	47	71
Diphtheria and Croup	266	206	Others...	2,896	2,795
Suicide	261	198			
Typhoid Fever	236	276	All Causes	18,886	17,874

Of the seven most numerous causes of death all showed increases except tuberculosis of the lungs, which was 7 per cent. below the average of the previous five years. As regards diseases ordinarily fatal to infants, there were decreases in congenital debility and convulsions, and increases in diarrhœa and enteritis, malformations, and premature birth.

Vaccination.—Vaccination is not compulsory, and, doubtless, the general feeling of security from infection in this State accounted for the very small number of people who voluntarily became vaccinated up to the end of 1912. In 1913 an epidemic of small-pox manifested itself in Sydney, and at the time of going to press, three-quarters of the Metropolitan population, and considerable numbers in the country districts, had submitted to vaccination.

The following is a return of persons vaccinated by the Government medical officers since the year 1903 :—

Age-groups of Persons Vaccinated.	1903.	1904.	1905.	1906.	1907.	1908.	1909.	1910.	1911.	1912.

Total	605	20	32	42	39	42	11	280	20	Nil.

Typhoid Fever.—The number of deaths from typhoid fever during 1912 was 236, equivalent to 1·36 per 10,000 living, which is 14 per cent. lower than the rate for the previous five years. The male rate was 1·65 and the female 1·03. This is essentially a preventable disease, and readily yields to sanitary precautions, but the rate is still high, notwithstanding the great improvement of the last twenty years. It is higher than in England, where in 1912 the rate was ·43 per 10,000, or less than one-third the rate in New South Wales.

The decline in the rate between 1888 and 1893 was very marked, and is to be traced to the influence of the Dairies Supervision Act, which began to operate in 1889. From 1893 to 1903 the rate was very even, and did not decline to any extent, but during the next quinquennium there was a considerable improvement.

The next statement gives the rate in the Metropolis and in the Country Districts during the last nineteen years, and, contrary to what might have been expected, the rate in the Metropolis has been only about two-thirds of that in the Country Districts. It would appear that the drainage of some of the country towns is very defective, or that the water supply is less pure than in the Metropolis.

Period.	Metropolis.		Country Districts.		New South Wales.	
	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.
1894–98	507	2·26	1,331	3·24	1,838	2·89
1899–1903	426	1·72	1,361	3·12	1,787	2·61
1904–1908	334	1·21	921	1·97	1,255	1·69
1909	86	1·44	201	2·65	287	1·82
1910	94	1·53	200	2·00	294	1·82
1911	54	·84	130	1·27	184	1·11
1912	59	·87	177	1·67	236	1·36

Most deaths occur in the summer and autumn. In 1912 there were 97 deaths in the summer months (December, January, February), and 77 in the autumn months (March, April, May).

Measles was the cause during 1912 of 371 deaths, equal to a rate of 2·13 per 10,000 living. The rate for males was 2·17, and for females 2·10, the male rate being the higher, which is contrary to the usual experience. In comparison with the preceding quinquennium the rate for 1912 is six times as great.

Measles

Measles is a disease chiefly affecting children, and is periodically epidemic. It was epidemic in 1912, the first occasion since 1898–99, when 719 deaths were recorded. Of the 371 deaths last year, 280 were of children under 5, and 64 of children under 1 year of age. The rate would be more accurately stated if the deaths were compared with the children living of like ages ; this will be found in a subsequent table giving the mortality rates of ages under 1 and under 5 from the diseases to which children are particularly liable.

Scarlet Fever.—In 1912 the number of deaths from this disease was 11, equivalent to a rate of 0·06 per 10,000 of the population, which is the lowest yet recorded, and 166·7 per cent. lower than the rate during the previous five years. The number of deaths in the Metropolis was 8, and in the remainder of the State 3, the equivalent rates being 0·12 and 0·03 respectively per 10,000 living in each, being the usual experience, which discloses a rate in the Metropolis about three times as large as in the Country Districts.

Scarlet fever, like measles, is an epidemic disease chiefly affecting children, and generally the rate for females is higher than for males. Scarlet fever is now not nearly so fatal as in former years. The last years of heavy mortality were 1893 and 1894, since when the rate has fluctuated, ranging from ·06 in 1912 to ·63 in 1898.

Whooping-cough is another of the diseases which chiefly affect children, and is more fatal to girls than boys. During 1912 the deaths from it numbered 118, of which 59 were of boys and 59 of girls. The rate was ·68 per 10,000 living, and is 46·5 per cent. below the average of the preceding five years In 1907 whooping-cough was epidemic, and 594 cases proved fatal, the rate being the highest since 1878.

This disease does not show any marked tendency to decline, the rate being maintained by epidemics. Of the children who died in 1912, 69 were under 1 year of age, and 113 under 5.

Diphtheria and Croup.—Diphtheria, with which is included membranous croup, was responsible for 253 deaths in 1912, while croup, so defined, was responsible for 13. The rate for the two together was 1·53 per 10,000 living, being 28·5 per cent. above the rate for the previous five years. In the Metropolis the number of deaths was 110, and in the remainder of the State 156, corresponding to rates of 1·63 and 1·47 per 10,000 respectively living in each. The rate for males was 1·42, and for females 1·65 per 10,000 living of each sex.

Until 1893 the rate did not show very much improvement, but it has since declined considerably, and is now less than one-fourth of what it was twenty years ago. Nearly 92 per cent. of the persons who died from diphtheria were under 10, and about 64 per cent. under 5 years of age.

Notifiable Diseases.—The following statement shows the total number of cases of notifiable infectious diseases and deaths reported to the Board of Health, with regard to the Metropolitan District during the years 1903 to 1912, together with the death-rate and the fatalities per 100 cases :—

Diseases.	Notified Cases.		Deaths.		Fatality per cent. (= Deaths per 100 cases).
	Number.	Rate per 10,000 of Population	Number.	Rate per 10,000 of Population.	
Scarlet Fever	10,995	18·91	160	0·28	1·5
Diphtheria	11,969	20·59	541	0·93	4·5
Typhoid Fever	6,455	11·10	661	1·14	10·2

During the last four years there has been an unusual prevalence of diphtheria, fortunately of a very mild type ; in 1912 the number was more than twice the decennial average. The number of typhoid fever cases was 18 per cent. below the average, and scarlet fever cases notified in 1912 were the lowest during the ten years.

It is interesting to compare the experience of Sydney with that of London, where the fatality from scarlet-fever is 1·24 per cent. of notified cases, from diphtheria 6·27 per cent., and from typhoid fever 16·62 per cent. The latter two diseases are more virulent in their effects in London, the rates being respectively 39 per cent., and 63 per cent. higher than in Sydney.

Influenza.—There were 131 deaths attributed to influenza during the year, equal to a rate of ·75 per 10,000, which is 34 per cent. below the average of the previous five years. The rate for males was ·81, and for females ·69 per 10,000 living. Prior to 1891 this disease was very little known, or rather few deaths were ascribed to it, but in that year there was a very severe epidemic, and it has since always been more or less prevalent. The majority of deaths from influenza occur in the four months, July, August, September, and October.

Tuberculous Diseases.—To the several forms of tuberculosis, 1,252, or 6·6 per cent. of the total deaths in New South Wales during 1912, are attributable, being equal to 7·20 deaths per 10,000 living. This rate was 9·4 per cent. below the average for the preceding five years.

Tuberculosis of Lungs, or Phthisis, as it is more commonly called, with 1,078 victims, or 86 per cent. of the deaths due to tuberculosis, caused more deaths during the year than any other disease, except diarrhœa, enteritis, cancer, and pneumonia. The equivalent rate is 6·20 per 10,000 living, that amongst males being 7·04 and amongst females 5·27 per 10,000. The rate improved steadily after 1885, until in 1912 it was the lowest on record, and 53 per cent. below the figure for the first-mentioned year. A slight rise occurred after 1907, when the rate was 6·33 per 10,000, but the rate for the year under review is 5 per cent. below the average for the five years 1907–11.

The decrease in the number of deaths from phthisis and other forms of tuberculosis may be attributed to the operation of the Dairies Supervision Act of 1886, the Diseased Animals and Meat Act of 1892, and the Public Health Act of 1896. The Board of Health is empowered by these Acts to supervise dairies and the production of milk, cream, butter, and cheese, and to prevent the sale of tuberculous meat.

If the deaths be distinguished in the two divisions of the Metropolis and the Country Districts, as in the following table, it will be seen that, in 1894–8, the rate in the former was 47 per cent. higher than in the latter. Since that period the rate for the Country Districts has remained fairly constant, but in the Metropolis the decline has been very marked, and amounts to 76 per cent.; the reason for the decline is the establishment of hospitals for the treatment of consumptives.

Period.	Metropolis.		Country Districts.		New South Wales.	
	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.	Deaths.	Rate per 10,000.
1894–98	2,302	10·26	2,872	6·99	5,174	8·15
1899–1903	2,490	10·03	3,136	7·18	5,626	8·21
1904–1908	2,184	7·89	2,985	6·40	5,169	6·96
1909	403	6·73	637	6·51	1,040	6·59
1910	443	7·21	614	6·13	1,057	6·54
1911	445	6·96	654	6·38	1,099	6·60
1912	393	5·82	685	6·45	1,078	6·20

The figures for the year 1912 show that out of the 1,078 persons who died from phthisis, 716 were born in Australia, and of the remainder, 76 had been resident in the Commonwealth less than five years, 46 from five to twenty years, and 215 for more than twenty years; in 25 instances either birthplace or length of residence was not stated.

The following comparison showing the death-rates from phthisis in various countries is interesting. The rates are stated per 1,000 of total population, and thus do not take into account either age or sex, which are rather material factors. If anything, this omission makes the comparison more favourable to New South Wales and other Australian States, because here the proportion of aged persons is smaller than in the countries of the old world. There is also possibly a variation in the methods of classification of the deaths in the various countries.

Country	Death-rate per 1,000 of Total Population.		Country.	Death-rate per 1,000 of Total Population.	
	1900-09.	1910.		1901-10.	1911.
Ireland	2·09	1·72	Victoria	1·01	·84
Norway	1·96	...	South Australia ...	·82	·70
Switzerland	1·81	...	Western Australia ...	·75	·75
Japan	1·50	...	*New South Wales* ...	*·73*	*·66*
Scotland	1·43	...	Queensland	·71	·60
Spain	1·41	1·25	New Zealand ...	·66	·53
Netherlands	1·33	1·18	Tasmania	·64	·60
England and Wales ...	1·19	1·02			

It will be seen that New South Wales stands fourth from the bottom of the above list. The rate in all the European countries is higher than in New South Wales, and the three with lower rates are Australasian States. The experience of the countries in the table is similar to that of New South Wales, namely, that the rate is decreasing.

Treatment of Phthisis in New South Wales.

Persons suffering from phthisis may receive treatment of a temporary character at general hospitals, but the special care and treatment of this disease is undertaken at the Government Hospital at Waterfall, and the Queen Victoria Home for Consumptives at Wentworth Falls and Thirlmere. To further combat the disease, the National Association for the Prevention and Cure of Consumption propose to establish anti-tuberculous dispensaries in this State, and inaugurate an educational crusade. During 1912 an Advisory Board composed of medical practitioners was appointed to advise the Government on matters relating to the treatment of tuberculous diseases. Arrangements are being made to establish dispensaries under Government control. Many consider that notification should be made compulsory throughout the State.

Tuberculosis of Meninges caused 59 deaths during the year, equal to a rate of ·34 per 10,000 living. Nearly all the victims were children, 43, or 75 per cent., being under the age of 5.

Abdominal Tuberculosis caused 47 deaths, of which 22 were males and 25 females. This is equivalent to a rate of ·27 per 10,000 living. Included under this heading are deaths from tabes mesenterica. The disease is mostly confined to children. Of those who died during 1912, 23, or 49 per cent., were under 5 years of age.

Other Tuberculous Diseases were responsible for 68 deaths, being at the rate of ·39 per 10,000 living.

Cancer.—There were 1,312 deaths from cancer in 1912, equal to a rate of 7·55 per 10,000 living, which is 4·6 per cent. above the average for the preceding five years. The total comprised 726 males and 586 females, the rates being 7·95 and 7·10 per 10,000 living of each sex respectively. In New South Wales generally the male rate is the higher, which is contrary to the experience of the United Kingdom, where the female rate preponderates.

The ages of the 1,312 persons who died ranged from 4 days to 102 years, but 95 per cent. were aged 35 and over.

Cancer is probably the most feared of all diseases, inasmuch as no specific remedy is known, and in all countries for which there are records the death-rate is increasing. In the following table the rates based on the whole population are given for certain countries. The comparison, being uncorrected for age incidence, is somewhat crude, but is apparently favourable to the Australian States.

Country.	Death-rate per 1,000 of Total Population.		Country.	Death-rate per 1,000 of Total Population.	
	1900-09.	1910.		1901-10.	1911.
Switzerland	1·28	...	New Zealand	·70	·80
Netherlands	·99	1·06	*New South Wales* ...	*·68*	*·74*
Norway	·95	...	Tasmania	·59	·63
Scotland	·90	...	Queensland	·59	·65
England and Wales ...	·89	·97	Western Australia ...	·52	·62
Victoria	·77	·83			
Austria	·75	·78			
South Australia	·72	·74

Italy	·58	...			
Spain	·46	·52			
Hungary	·40	·46			

Compared with these countries, there are six with rates lower than New South Wales, of which three are outside Australia. In all the above countries the rate shows a tendency to increase.

Diabetes.—To this cause were attributed 149 deaths in 1912, equal to a rate of ·86 per 10,000 living, which is 3·4 per cent. below the average for the preceding five years. The rate for males was ·64 and for females 1·10 per 10,000 living of each sex. Most of the deaths occur after middle life. Of the above total, 110 were of persons over 45 years of age.

Meningitis.—To inflammation of the brain or its membranes were ascribed 167 deaths, equal to a rate of ·96 per 10,000 living. This is 2 per cent. below the average rate during the previous five years. The disease is principally one of childhood. Of those who died during the year, 98, or 59 per cent., were under 5 years of age. Included in the total are 30 deaths from cerebro-spinal fever.

Hæmorrhage of the Brain.—To cerebral hæmorrhage and apoplexy there were due 611 deaths, of which 345 were males and 266 females. The rate is 3·51 per 10,000 living, 3·78 for males and 3·22 for females, in each case being above the average. Generally the male rate is a little higher than the female. There has been little difference in the rate for many years—it has fluctuated, first with a tendency to decrease down to 1895, and then to increase. Possibly the variations in the rate are due to some extent to differences in classification.

Convulsions (Children under 5) caused 163 deaths during 1912, or at the rate of ·94 per 10,000 living, which is 20 per cent. below the average of the previous five years. This disease, however, being entirely confined to children under 5, the rate is more properly stated as a proportion of those ages. Comparing, therefore, the deaths with the number living at those ages, the rate during 1912 was ·77 per 1,000, as against ·98, the average of the previous five years.

Insanity.—Insanity is classed as a distinct disease of the nervous system, but of the total number of deaths of insane persons in 1912 only 155 deaths appear in the tables as due to insanity (including general paralysis of the insane), the remaining deaths being attributed to their immediate cause. The death-rate of persons dying from insanity per 10,000 living was 1·63 in the case of males and ·42 in the case of females.

Practically all the insane persons in New South Wales are under treatment in the various Hospitals for the Insane. At the end of 1912 there were 6,470 persons under official control and receiving treatment. This is equal to 3·64 insane persons per 1,000 of population. The average during the preceding five years was 3·70 per 1,000.

The percentage of deaths of insane persons in New South Wales is comparatively light. In 1912 there were 501 deaths, or 8·17 per cent. of the average number resident. The males who died numbered 335, and the females 166, the rates being 9·01 and 6·87 per cent. respectively.

Diseases of the Heart.—Diseases of the heart were the cause of 1,881 deaths, equivalent to a rate of 10·82 per 10,000 living. Of the total 1,130 were males and 751 females, the rates being 12·38 and 9·10 per 10,000 living respectively. The rate is 5·9 per cent. above the average for the preceding five years.

The ages of the persons who died ranged up to 100 years; and, as might be expected, the great majority of deaths occurred after middle age had been passed, 1,505 being of persons over 45 years of age.

Included in the total are deaths from pericarditis, endocarditis, organic diseases of the heart, and angina pectoris. The largest number of deaths (about one-half of the total) was attributed to "heart disease," without further definition—that is to say, without the particular cardiac lesion being specified.

Heart disease, on the whole, is on the increase, although it may be that part of the increase is due to a better acquaintance with the action of the heart, and that many deaths which were formerly attributed to old age are now ascribed to some form of heart disease.

The death-rate for males generally is higher than for females, probably due to the greater risks and shocks to which males are exposed. The rates in 1912 were generally higher than in the previous decennium.

Bronchitis caused 552 deaths, equivalent to 3·17 per 10,000 living, which is 3·6 per cent. below the mean rate of the previous five years. The rate for males was 3·48, and for females 2·83. Of the total deaths 231 were stated to be due to acute and 321 to chronic bronchitis. This disease chiefly affects the extremes of life. In 1912, of those who died, 146, or 26 per cent., were under 5, and 322, or 58 per cent., over 65 years of age.

Pneumonia.—The total deaths ascribed to pneumonia were 1,098, equal to a rate of 6·32 per 10,000 living. Included in the total are 367 deaths which were ascribed to broncho-pneumonia. Among males the rate was 7·66, and among females 4·83, per 10,000 living of each sex respectively. The rate is 9·1 per cent. above the average of the previous five years. Most

Most deaths from pneumonia occur in the cold weather. In 1912 there were 327 deaths, or 30 per cent., in the three months June to August.

There has been little reduction in the mortality for some years. There was a drop after 1888, but it then steadily increased, with a few fluctuations, to the highest point on record in 1902. The general rates, however, for the last ten years have been much below the figure for that year. Pneumonia is most destructive amongst young children and old persons, and is more fatal to males than to females.

Diseases of Digestive System.—The deaths attributed to these diseases numbered 2,598, equivalent to 14·94 per 10,000 living, the rates for males and females being 15·45 and 14·38, as compared with 14·69 and 12·69 respectively, the rates during the preceding five years. The deaths in this system were ascribed mainly to diarrhœa and enteritis, which, with cirrhosis of the liver and appendicitis, are discussed below. Gastritis caused 114 deaths, 49 being of children under 5 years of age; and 44 deaths were caused by gastric ulcer.

Diarrhœa and Enteritis.—In 1912 there were ascribed to these two causes 1,741 deaths, or 10·01 per 10,000 living, which is 13·4 per cent. above the average of the preceding five years. The rate for males was 10·40, and for females 9·61 per 10,000 living. According to the Bertillon classification, deaths from these diseases are divided into two groups—one including children under 2 years of age, and the other all persons 2 years of age and over. In the first group there were 1,402, or 81 per cent. of the total, and in the second 339. The mortality rate of children under 2 years during 1912 was 13 per cent. above the average during the previous five years, being 15·77 per 1,000 children under 2, as compared with 14·01 during the years 1907–11. Of the total deaths from these causes 830, or 48 per cent., occurred in the three summer months, January, November, and December; and 518, or 30 per cent., in the autumn, February, March, April. As a rule, over 50 per cent. of the deaths occur in the summer quarter.

Appendicitis.—To this cause 136 deaths were ascribed in 1912, the rate being ·78 per 10,000 living, which is 5 per cent. below the average of the preceding five years. The rate for the males in 1912 was ·85, and for the females ·70 per 10,000 living. This disease is much more fatal to males than to females.

Cirrhosis of the Liver was responsible in 1912 for 148 deaths, the rate being ·85 per 10,000 living, which is 18 per cent. above the average of the previous five years. This disease is much more prevalent among males than females—the rate for the former in 1912 being 1·26, and for the latter ·36 per 10,000 living in each sex—and is of interest in connection with the subject of intemperance.

Bright's Disease.—Of the 1,132 deaths due to diseases of the urinary system, 840 were caused by chronic nephritis or Bright's disease, and 83 by acute nephritis. Taking these two diseases together, the rate was 5·31 per 10,000 living, for males 6·36, and for females 3·75. This rate is 16·4 per cent. above the mean rate of the previous five years.

Not many persons under 35 die from nephritis, the proportions per cent. for 1912 being: Under 35, 13·1; and over 35, 86·9.

Deaths in Childbirth.—The number of deaths of women in 1912 from the diseases of childbed was 305, corresponding to a rate of 5·9 per 1,000 births. Of these, 117 were due to puerperal septicæmia, 39 to accidents of pregnancy, and 149 to other puerperal accidents. On the whole, the deaths resulting from various diseases and casualties incident to childbirth are about 7 per 1,000 births, or 1 death to every 147 births. During the twenty years ended 1912, the deaths were as follows:—

Cause of Death.	1893–1896.	1897–1900.	1901–1904.	1905–1908.	1909–1912.	1893–1912.	
						Total Deaths.	Proportion due to each cause.
							per cent.
Accidents of Pregnancy	132	197	176	280	143	928	17·14
Puerperal Hæmorrhage	142	159	135	106	114	656	12·11
Puerperal Septicæmia	369	362	378	295	442	1,846	34·08
Albuminuria and Eclampsia ...	100	126	113	141	179	659	12·17
Other Casualties of Childbirth ...	272	279	256	301	219	1,327	24·50
	1,015	1,123	1,058	1,123	1,097	5,416	100·00

Owing to the changes in classification of causes of death, the figures for the last eight years are not quite on the same basis as those for previous years, but the differences are only slight.

During the twenty years, 1893–1912, of the 5,416 women who died from diseases of childbirth, 4,865 were married, and 551 single, and as there were during this period 744,351 legitimate and 53,418 illegitimate births—reckoning cases of twins and triplets as single births—it follows that amongst married women the fatal cases average 6·5 per 1,000 births, or 1 in 153, and amongst single women 10·3 per 1,000, or 1 in 97.

Violence.—Of 18,886 persons who died during the year, 1,399, or 7·41 per cent., met with violent deaths. The rate was 8·05 per 10,000, being 4·2 per cent. higher than the mean rate during the previous quinquennium. The mortality rate from violence amongst males is three times as great as for females, since of the deaths of this kind 1,085, or 11·88 per 10,000 living, were of males, and 314, equal to 3·81 per 10,000, were of females.

Accident.—The number of fatal accidents during the year was 1,027, viz., 809 of males and 218 of females, equal to rates of 8·86 and 2·39 per 10,000 living of each sex. The general rate was 5·91 per 10,000 living, which shows an increase of 2 per cent. as compared with the average for the previous five years. Accidental deaths have always been very numerous, especially in the country. Of the total number registered during 1912, 327 occurred in the Metropolis, and 700 in the Country Districts. As a rule, about three-fourths of the accidents occur in the Country, which contains about five-eighths of the total population.

Although the accident rate is still high compared with that of more settled countries, it has been steadily decreasing. Among males the fall has been more rapid than amongst females. Experience shows that out of every 1,000 accidents, 163 are due to drowning, 136 to burns or scalds, 151 to vehicles and horses, 107 to falls, 87 to railways and tramways, 50 to mines and quarries, and 38 to weather agencies. The greatest number of accidents to males are due to drowning, and to females to burns or scalds.

Suicide.—The number of people who took their own lives during 1912 was 261, equal to a rate of 1·50 per 10,000 living, which is 32 per cent. above the average of the previous five years. The number of males was 192, equal to a rate of 2·10 per 10,000 living, and of females 69, equal to ·76 per 10,000, so that the rate for males is three times as great as that of females. The

The means usually adopted by men for self-destruction are shooting, poisoning, cutting, or hanging. Amongst women weapons are avoided, and poison has been the means most often used. Out of every 100 cases during the last five years, 31 are by poisoning, 29 by shooting, 16 by cutting, 13 by hanging, and 8 by drowning.

Experience shows that morbidity is largely influenced by the seasons. As regards suicides this is most plainly seen amongst the males, who are more inclined to self-destruction in the last quarter of the year. For the ten years ended 1912 the proportion of male suicides per 1,000 during the first quarter of the year was 258; second, 227; third, 242; and fourth, 273. January, February, and December, the three hottest months of the year, usually have the largest record of suicides.

Female suicides, classified by quarters for the same period, show the highest proportion during the first quarter of the year, the figures being as follows:—First quarter, 267 per 1,000; second, 235; third, 250; and fourth, 248.

Seasonal Prevalence of Diseases.

The statement below shows the principal diseases, the deaths from which vary according to the seasons. The figures are based on the experience of the ten years 1903–12, and represent the proportion of deaths in each month per 1,000 deaths during the year from each cause. The actual returns were adjusted on account of the unequal number of days in the various months to render the figures comparable.

Month.	Typhoid Fever.	Influenza.	Diphtheria and Croup.	Whooping-cough.	Phthisis.	Pneumonia.	Bronchitis.	Diarrhœa, Enteritis, and Dysentery.	Bright's Disease.
January	141	37	44	90	79	48	47	152	76
February	144	18	71	74	71	43	42	127	72
March	148	18	78	61	76	46	43	111	68
April	132	30	115	86	81	60	61	110	77
May	108	45	120	86	86	77	82	69	85
June	67	86	123	72	86	102	119	40	89
July	37	119	100	85	90	119	138	29	96
August	31	178	93	95	94	134	140	24	96
September... ...	26	184	85	86	90	125	127	25	91
October	25	138	53	89	88	95	83	46	80
November... ...	44	92	65	81	82	84	69	117	88
December	97	55	53	95	77	67	49	150	82
	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000	1,000

The chief feature of the above table is the contrast between typhoid fever and diarrhœa and enteritis on the one hand, and influenza, pneumonia, and bronchitis on the other. In the first group the influence of the warm weather is the controlling factor, and in the second the cold weather. The warmest three months in the year are December, January, and February; and the coldest June, July, and August. Phthisis does not vary a great deal throughout the year, but the rates show that in the cold months the deaths are most frequent. Bright's disease also is most fatal in the cold weather.

Causes of Infantile Mortality.

The mortality of infants in New South Wales was exceptionally low during the seven years 1904–10. An upward movement in 1907, when the rate was higher than in any of the three preceding years, was followed by a decline in the following year; in 1910 there was a slight increase, but in 1911 the rate was the lowest on record. In 1912 the rate was 71·3 and 4 per cent. above the previous year. Prior to 1904 there had been practically little change in the rate for thirty years. From 1860 to 1873 the rate was lower than in the years immediately preceding 1904. At the very early ages children are most susceptible to the attacks of disease, and the rates for preventable diseases are highest. Any bettering of conditions and consequent saving of infant life is a gain to the whole community. In New South Wales, out of every 10,000 children born, about 1,000 die before reaching their fifth year.

As the death-rate of infants is usually looked upon as a reliable sanitary test, and as it is of interest to know the diseases most fatal to children, the following statement has been prepared. It shows the principal causes of death of children—under 1 per 1,000 births and under 5 per 1,000 living—in 1912 and in the five years 1907–11, distinguishing deaths in the Metropolis from those in the Country districts.

Causes of Death.	Deaths under 1, per 1,000 Births.						Deaths under 5, per 1,000 Living.					
	Metropolis.		Country.		New South Wales.		Metropolis.		Country.		New South Wales.

All others	9·0	10	9·2	9·6	9·1	9·9	3·5	4·3	3·7	4·0	3·6	4·1
Total	82·1	75	73·1	68·3	76·3	71·3	26·4	29·0	22·2	21·7	23·8	24·3

There was a considerable improvement in 1912, as compared with the preceding five years, notwithstanding they were years of low mortality. Among children under 1 the reduction amounted to 6·5 per cent., while children under 5 show a slight increase (2·1 per cent.)

It will be seen that the high mortality of infants is due to the deaths of children who from the beginning are greatly weakened either from immaturity or debility at birth. Of children under 1, the deaths from these causes in 1912 were equal to 25·8 per 1,000 births, or 36 per cent. of the total deaths of children at that age. A previous table shows that the mortality during the first month of life is over two-fifths of the total mortality during the whole of the first year, and 71 per cent. of this mortality is due to deaths from congenital debility or defects. After these, in 1912, came diarrhœa and enteritis, which were responsible for deaths to the extent of 22·4 per 1,000 births. The deaths from infectious diseases amounted to 2·8 per 1,000 births, of which whooping-cough alone caused 1·3. Respiratory diseases are rather fatal to children, bronchitis, in 1912, accounting for 2·2, broncho-pneumonia for 2·8, and pneumonia for 1·1 per 1,000 births. These respiratory diseases showed decreases in 1912. Convulsions had a death-rate of 2·3, tuberculous diseases of 0·5, and meningitis (not tuberculous) of ·8 per 1,000 births.

It has already been pointed out that life in the Metropolis is more unfavourable to children than in the Country. The total excess mortality in the Metropolis is 11 per cent., but the mortality from diarrhœa and enteritis is 43 per cent. higher than in the Country, and it should be noted that the rates from these causes in 1912 are above the quinquennial average in both divisions.

Turning to the second part of the table, dealing with children under 5, it will be found that the most fatal causes, as in the case of children under 1, are diarrhœa and enteritis, congenital debility, pneumonia, and bronchitis, in that order, with the exception of measles, which shows an increase at the higher age.

A further statement is given below in which the cause of death of illegitimate children are compared with those of legitimate children. The figures represent the deaths of children under 1 per 1,000 births in the State as a whole in 1912.

Causes of Death.	Deaths under 1 per 1,000 Births.		
	Legitimate.	Illegitimate.	Total.
Measles	1·1	3·1	1·2
Scarlet Fever	0·0	0·0	0·0
Whooping-cough	1·3	2·4	1·3
Diphtheria and Croup	0·3	0·3	0·3
Tuberculosis—Meninges	0·2	0·3	0·2
,, Peritoneum	0·1	1·0	0·2
,, Other Organs	0·1	0·7	0·1
Syphilis	0·5	4·1	0·7
Meningitis	0·7	2·8	0·8
Convulsions	2·2	3·4	2·3
Bronchitis	2·1	3·7	2·2
Broncho-pneumonia	2·7	3·7	2·8
Pneumonia	1·0	2·4	1·1
Diarrhœa and Enteritis	19·6	69·2	22·4
Congenital Malformations	2·5	4·8	2·6
Infantile Debility	6·6	18·4	7·3
Premature Birth	15·2	28·3	15·9
All others	9·3	20·1	9·9
Total	65·5	168·7	71·3

The reasons for the greater mortality of illegitimate children are seen from this table. Excluding diseases which may be ascribed to inherent weakness, there is strong evidence of neglect or want of care as regards these unfortunate children. Infantile debility showed 51·5 per 1,000 births, as against the legitimate rate, 24·3. Diarrhœa and enteritis were 69·2, as compared with 19·6 ; respiratory diseases 9·8, as compared with 5·8 ; and syphilis 4·1, as compared with 0·5. Among the epidemic diseases the great difference was in deaths from measles—3·1 as against 1·1.

* In this table persons who died in Hospitals from Epidemic Diseases have been distributed amongst the Municipalities where they ordinarily resided. There were 244 such deaths, the origin of which was as follows:—

Sydney 70	Erskineville 3	Botany 5	Ashfield 5	Marrickville... ... 8	North Sydney ... 2
Balmain 5	St. Peter's 7	Mascot 3	Burwood 3	Petersham 6	Mosman 2
Leichhardt 10	Redfern 17	Paddington 9	Enfield 3	Canterbury 3	Willoughby 7
Annandale 4	Darlington 4	Randwick 7	Concord 2	Hurstville 2	Manly 1
Glebe 9	Waterloo 7	Waverley 2	Strathfield 1	Kogarah 4	Hunter's Hill ... 3
Newtown 12	Alexandria 7	Woollahra 4	Drummoyne 1	Rockdale 6	

For the reason stated, the deaths in institutions quoted above differ from those in Tables Nos. 17 and 20 by 148.

* Deaths in Hospitals, &c., in 1903 and 1904 were distributed according to the districts where the deceased children had ordinarily resided.

Note.—In 1909, Camperdown, which up to the end of 1908 was a separate municipality, was incorporated with the City of Sydney.
